

Phone Charging Holder

By: Caroline L. and Hanna D.

Phone Charger Holder

The regular phone charger, when being used, is either placed on a ground or an object, this product we made makes it so the phone is charging closer to the outlet so it prevents knocking or stepping on your phone. We chose it because we thought of how modern it is to use our phones so much, eventually charging it. we thought how much it would help some people if they could charge in style and also help prevent damages, so ta-da! Our thing was invented.

Things we had to change to overcome the problems

The holder was less stable than expected, so when we put it on the wall it would dip down. We figured that it would be a problem so we decided to make the sides stronger and to add more hot glue and duct tape.

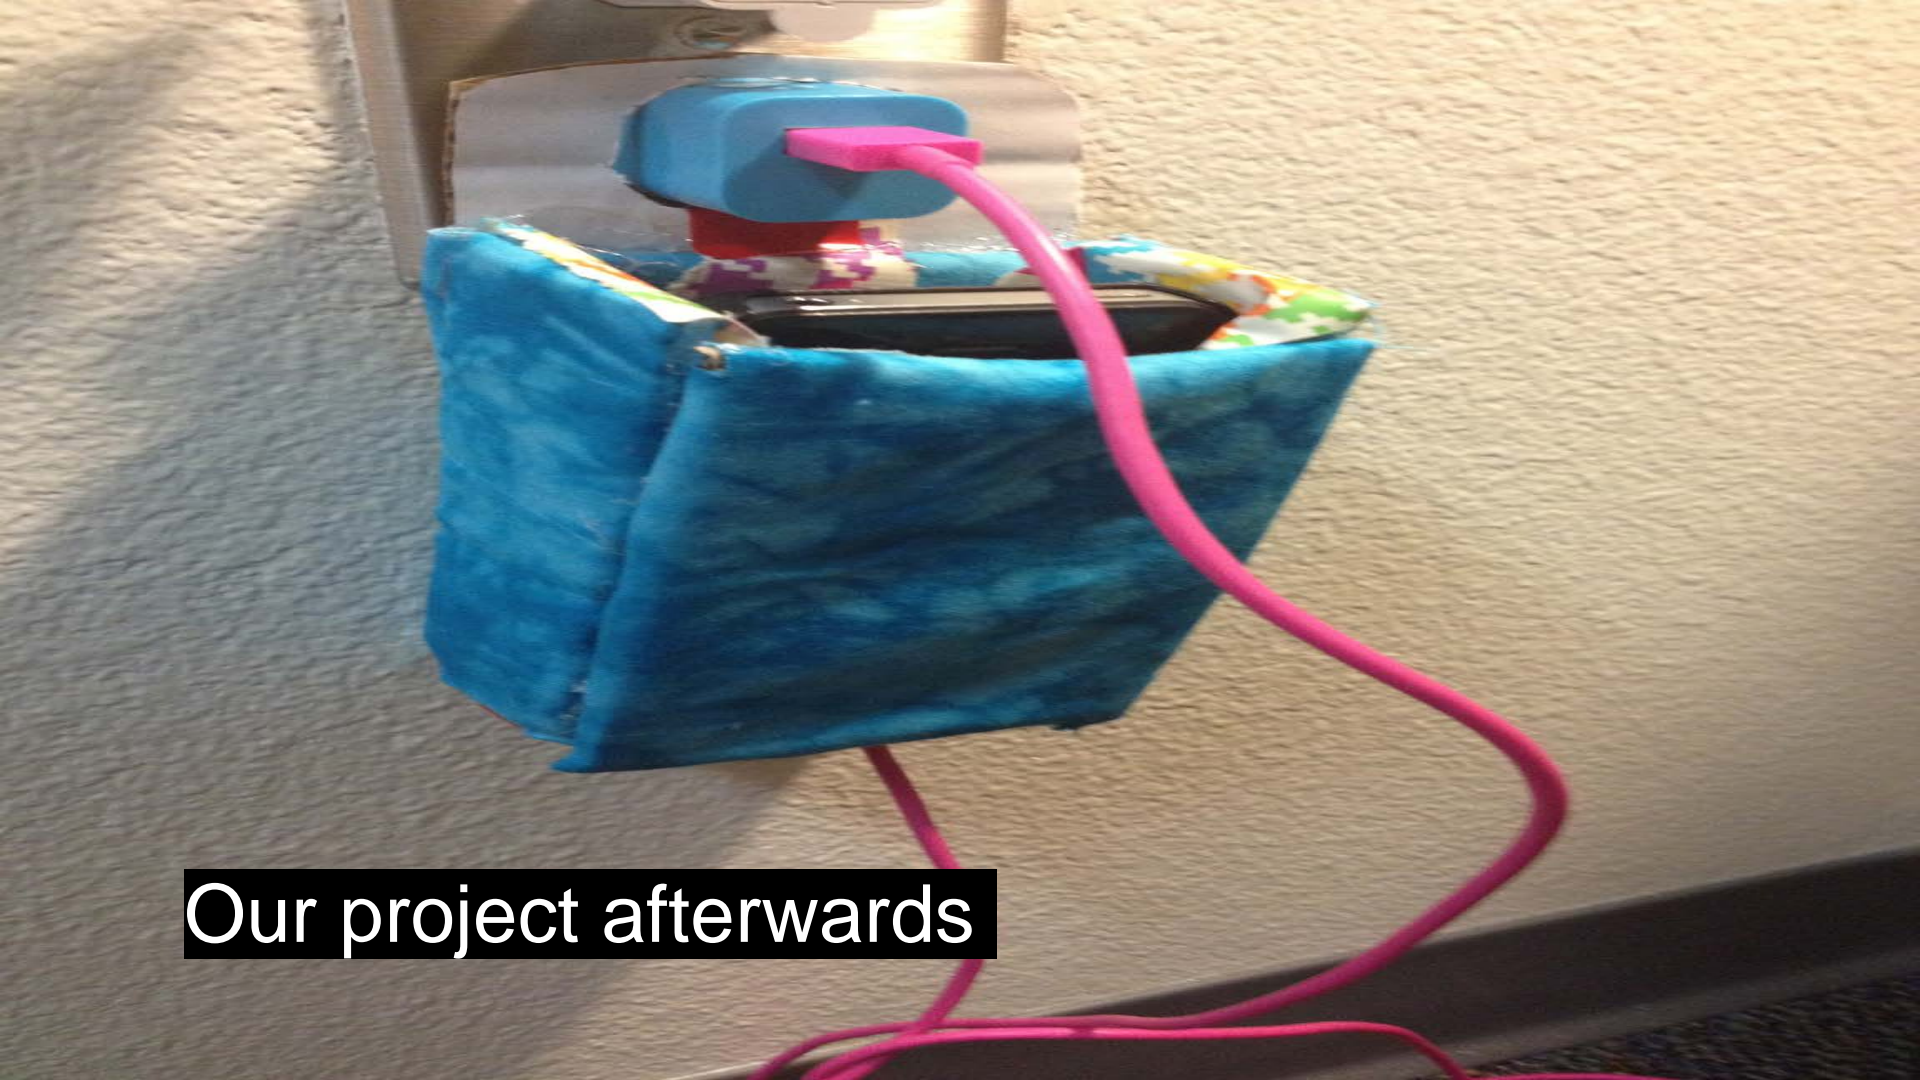

Things we would change and things we did well on

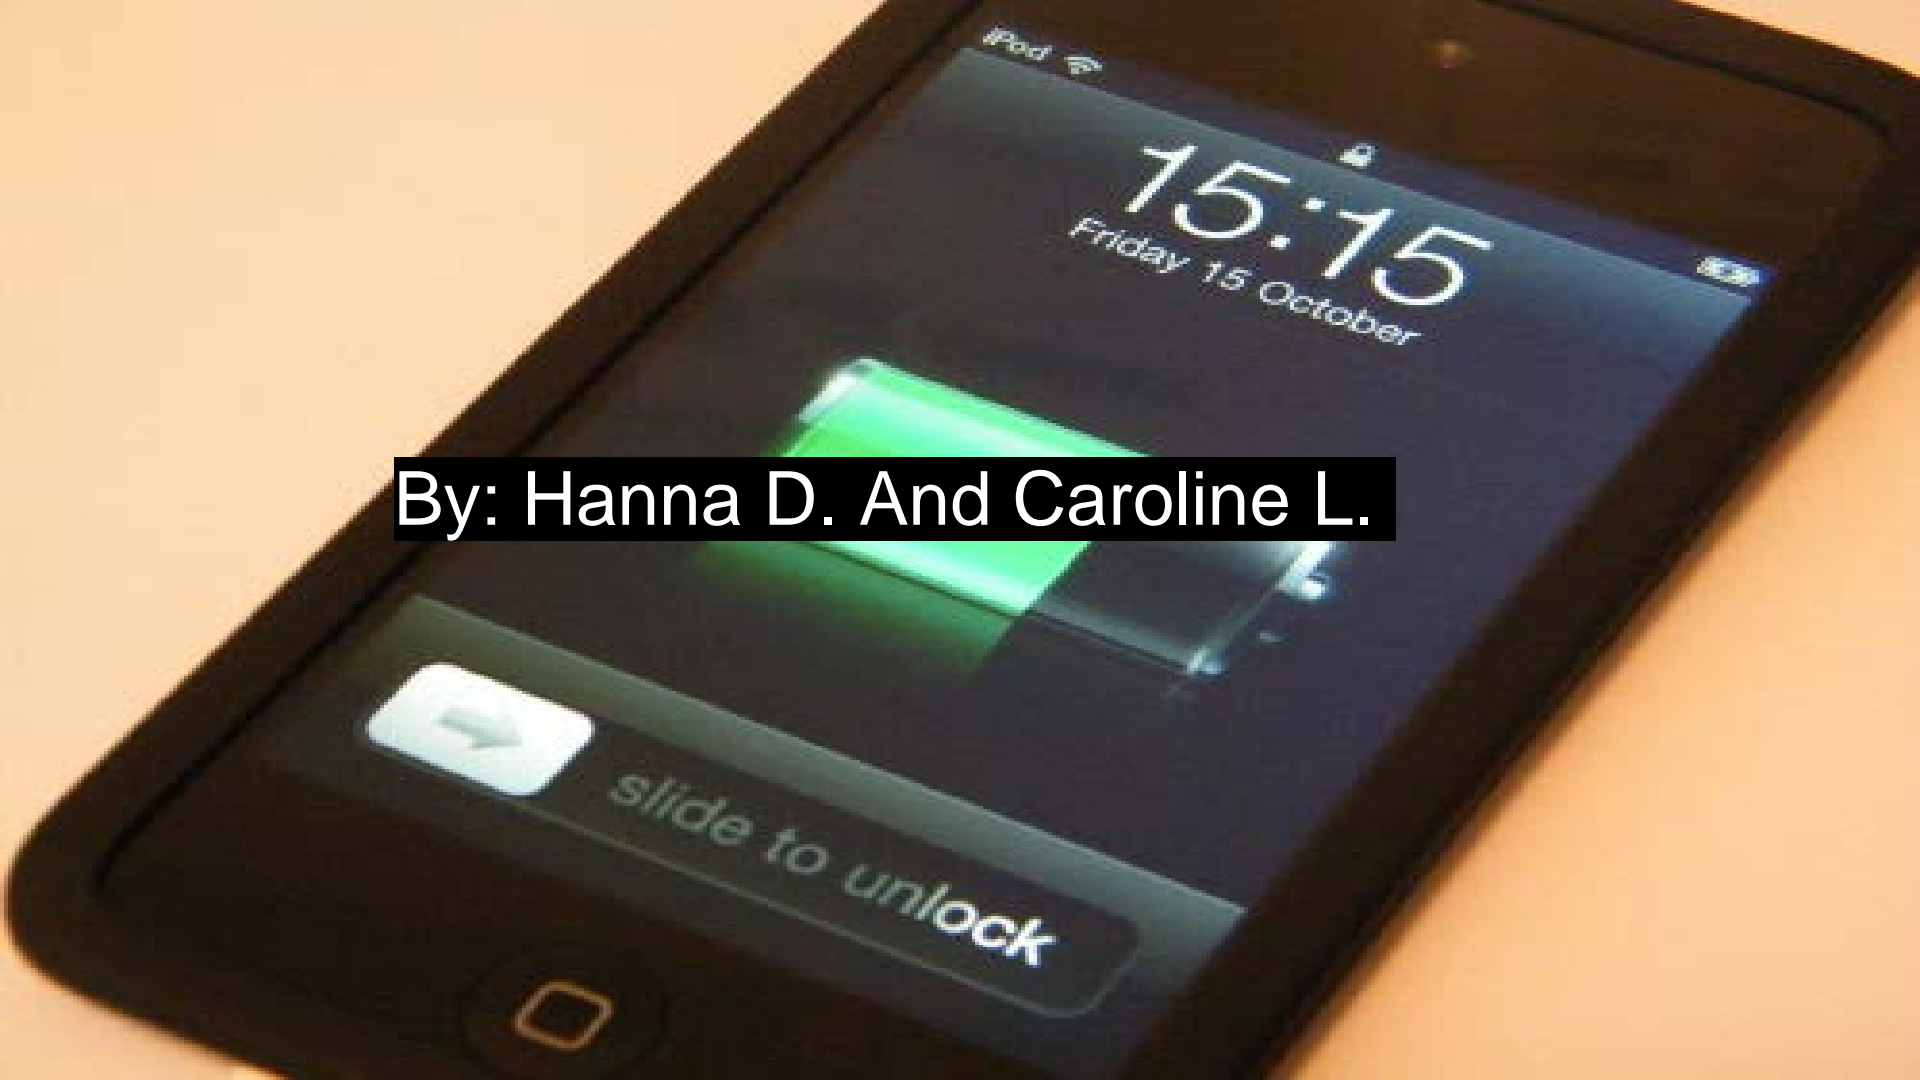

The things we would change next time we would change when making this, is to probably make it bigger in size and make it less crowded in general with all the duct tape, hot glue, and cardboard all squashed together.

Problem without The holder

Our project afterwards
